

GitFit

Milestone 1.5

API Features 1:

API feature 1(Open weather API integration) is near completion. The API can fetch data for a certain location. Only thing left to do is display the info based on the user's location. Currently all the needed info is logged to the console.

API Features 2:

API feature 2(Wger API integration). This API implementation will start this week. After the first API feature is done. After that we will get weather data and suggest workouts based on that. This API integration will take more time to implement than the first API as there is a lot more complexity to it.

Application Interface:

The main Application Interface is near completion, the CSS has been added. Only thing left to do for the application interface is to add and show weather icons based on the user's current weather.

CI/CD:

The CI/CD pipeline is almost complete. Every commit onto the main branch will trigger a pull request. Then there will be tests done to ensure a certain degree of functionality. If it passes these test then it is pushed onto the main branch for further testing.

Application Testing (API 1)

1. Ensure proper error handling (invalid location)
2. Load testing-> making sure the API responds properly when multiple users using the app
3. Making sure the correct weather data is presented to the user
